

Practical-4.(e)

Aim: Write a C++ program that illustrate single inheritance.

Algorithm:(i)Start

(ii)class <derived_class_name>:<access-specifier>

(iii)<base_class_name>

(iv)//body

(v)Stop

Theory: Using inheritance, we have to write the functions only one time instead of three times as we have inherited the rest of the three classes from the base class.

Input:

```
#include <iostream>
```

```
class base
```

```
{
```

```
    public:
```

```
    int x;
```

```
    void getdata()
```

```
    {
```

```
        std::cout<<"Enter the value of x= ";
```

```
        std::cin>>x;
```

```
    }  
};  
class derive:public base  
{  
    private:  
    int y;  
    public:  
    void readdata()  
    {  
        std::cout<<"Enter the value of y= ";  
        std::cin>>y;  
    }  
    void product()  
    {  
        std::cout<<"Product= "<<x*y;  
    }  
};  
int main(){  
    std::cout<<"08_Rabin Nadar"<<std::endl;
```

```
derive a;  
a.getdata();  
a.readdata();  
a.product();  
return 0;  
}
```

Output:

Output

Clear

/tmp/9AECLqMLtR.o

08_Rabin Nadar

Enter the value of x= 5

Enter the value of y= 5

Product= 25
